Introduction to WiFi in the Linux Kernel

Wireless fidelity (WiFi) has become an essential aspect of modern computing, facilitating mobility and convenience. Linux's support for WiFi has evolved significantly over the years, moving from basic drivers to a sophisticated, modular framework capable of supporting a broad spectrum of hardware.

The Linux kernel's WiFi subsystem enables devices to discover, connect, and communicate over wireless networks by integrating drivers, protocols, and user-space tools. It acts as the core interface between hardware devices and user-space applications such as NetworkManager, wpa_supplicant, and others that facilitate network management.

Architecture of WiFi Support in the Linux Kernel

The Linux kernel's WiFi support is structured into several layers and components, each responsible for specific functionalities. Understanding this architecture is key to grasping how wireless networking operates within Linux.

Hardware Drivers Layer

This is the lowest level of the WiFi subsystem, directly interacting with wireless hardware devices. Drivers in this layer are responsible for:

- Initializing hardware
